I tried to perform testing of the Cohortney project. Unfortunately, it is not clear how to launch tests as I didn't find anything about them neither in the report nor in the readme. Also I tried running junk_experiment.ipynb which I assume tests the training procedure but since it uses some of the old imports that are not in the project anymore it didn't work. Launching run.py doesn't work as well as there are some problems with path.

Baseline evaluation results are not presented in the report or on github, so I cannot comment on it either.

However, since the project structure is very clean and the code is nicely documented, I assume the team has done the major part of the work and just needs more time to provide evaluation and tests.

From the aforementioned traits of the project I assume that adding a new method to it could be done relatively easy.
